

SITE ANALYSIS

Location: Jalandhar, model town (Punjab)
Area: 2394 sqm
Roads: 2 access road+1 main road
Climate: composite
Soil: alluvial

Prime urban location
Excellent connectivity
Well-connected to major roads, NH-44, railway stations
Site fronts a primary road → high visibility & accessibility
Schools, hospitals, markets within close proximity

JALANDHAR MAP

High density surroundings
Limited open spaces nearby
Small parks and lack of large green buffers
Noise pollution
Due to commercial spillover and vehicular movement
Infrastructure strain

TRAFFIC

SATELLITE VIEW

Commercial potential
Area transitioning from residential → commercial hub
Possibility to introduce:
Sustainable design (rainwater harvesting, green roofs)
Community-oriented design
Opportunity to create:
Semi-public spaces
Courtyards (rare in dense fabric)

Traffic + parking issues
Encroachment and roadside parking congestion
Environmental concerns
Air pollution + garbage issues in some areas
Unplanned development
Regulatory constraints
Zoning changes (residential → commercial) may affect design permissions

SITE AREA

SUN PATH DIAGRAM

Jalandhar has a composite climate characterized by hot summers (35–45°C), cold winters (5–15°C), and moderate monsoon rainfall (700–800 mm annually). The monsoon season introduces high humidity and risks of waterlogging due to heavy rainfall. These conditions demand design strategies such as shading from harsh west sun, cross ventilation, green buffers, and efficient drainage systems to ensure thermal comfort and sustainability.
